EARTH JUKEBOX

Temperature Environmental Report

NASA Earth Observation Analysis and Scientific Sonification

CONDITION	LOCATION	DATE RANGE
Temperature	Lat: 19.076 Lon: 72.8777	2020-01-01 to 2025-12-31

1. Statistical Overview

Metric	Value
Observation count	72
Mean	26.8224 °C
Median	26.49 °C
Minimum	21.28 °C
Maximum	32.2 °C
Range	10.92 °C
Standard deviation	2.8293 °C
First-to-last change	0.17 °C
First-to-last percentage change	0.78%

2. AI-Assisted Environmental Interpretation

This report analyzes 72 monthly temperature observations collected at latitude 19.076, longitude 72.8777 from January 2020 through December 2025 using NASA POWER gridded climate data. The observed mean temperature over this period was 26.8224 degrees Celsius, ranging from a minimum of 21.28 degrees Celsius to a maximum of 32.2 degrees Celsius.

Key Findings

• Over the 72 monthly observations, the mean temperature was 26.8224 degrees Celsius with a median of 26.49 degrees Celsius and a standard deviation of 2.8293 degrees Celsius.

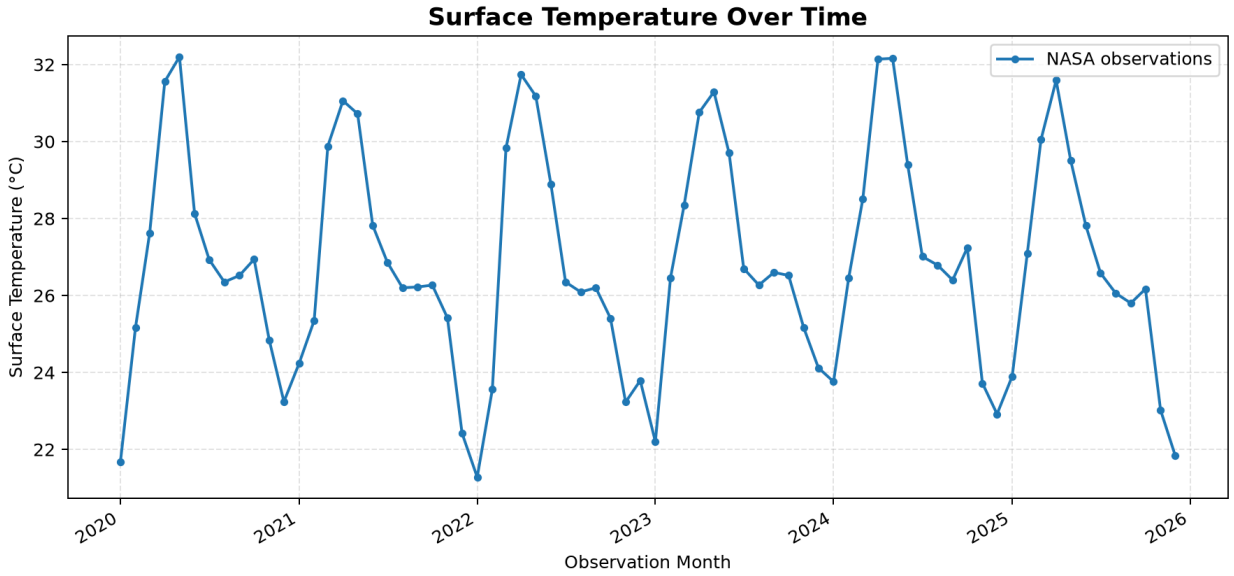

• Temperatures varied across a range of 10.92 degrees Celsius, recorded between a minimum of 21.28 degrees Celsius in January 2022 and a maximum of 32.2 degrees Celsius in May 2020.

• The initial observation in January 2020 was 21.67 degrees Celsius and the final observation in December 2025 was 21.84 degrees Celsius, representing a net change of 0.17 degrees Celsius (0.78%).

5. Scientific Limitations and Disclaimer

• This report summarizes the observations returned by the configured NASA data adapters. It is not a substitute for local ground-station measurements.

• The requested date range is passed to the data adapters as start and end years. Some adapters may return observations at their native temporal resolution rather than exact daily coverage of the requested dates.

• Descriptive statistics describe the retrieved observations only. They do not establish causation or guarantee future conditions.

• Sonification parameters are deterministic mappings of the retrieved values. They are not additional scientific measurements.

• NASA POWER temperature is gridded/model-assimilated data and may differ from measurements at a nearby weather station.

• NASA POWER data consists of gridded and model-assimilated measurements, which may differ from precise local ground-station measurements.

This document is an analysis of retrieved NASA Earth observation data. It is not an official NASA forecast, emergency warning, or substitute for professional environmental assessment.

6. Scientific Sonification Parameters (72 mappings)

Sound profile: Warm Analog Sine & Tonal Brightness

Mapping description: Direct frequency mapping representing thermal energy; higher values increase pitch brightness.

Musical key: A

Scale mode: pentatonic_minor

Dynamic range minimum: 21.28

Dynamic range maximum: 32.2
